UNIVERSITY

FACULTY OF NATURAL RESOURCES AND ENVIRONMENTAL SCIENCES

DEPARTMENT OF FISHERIES AND WATER RESOURCE MANAGEMENT

THE FUTURE OF THE NILE PERCH CATCHES AND VALUE AND IT'S MAW.

A CASE STUDY AT KIYINDI LANDING SITE, LAKE VICTORIA, UGANDA

BY

KAFUBA JAMES BUYINZA

BU/UP/2020/2923

**A DISSERTATION SUBMITTED TO THE DEPARTMENT OF FISHERIES AND WATER
RESOURCE MANAGEMENT IN PARTIAL FULFILMENT OF THE REQUIREMENTS
FOR THE AWARD OF A DEGREE OF FISHERIES AND WATER RESOURCE
MANAGEMENT OF BUSITEMA UNIVERSITY, NAMASAGALI CAMPUS**

OCTOBER, 2023

DECLARATION

I, Kafuba James Buyinza declare that this work is original and it has never been submitted to any University or higher institution of learning for any academic award.

SIGNATURE:

DATE.....

KAFUBA JAMES BUYINZA

APPROVAL

I hereby affirm that this dissertation has been developed under my guidance and supervision.

SUPERVISOR

SIGNATURE.....

DATE:.....

Dr Bassa Samuel (PhD)

DEDICATION

I dedicate this dissertation to my family and friends for all their unconditioned, compassionate care, guidance and support.

ACKNOWLEDGMENTS

Exaltation is to the All-Powerful God for His guidance and protection through many situations right from the Pandemic of Covid-19 to the accomplishment of this original research report.

In a special way, I acknowledge my Supervisor, Dr. Bassa Samuel (PhD) for his diligent supervision of this research. I also extend my sincere appreciation and gratitude to the Head of Department Dr. Vianny Natugonza who has tirelessly worked towards my success and his continuous advise. Not forgetting all my dear lecturers, who have endeavoured to shape me academically.

I also extend my sincere gratitude to my fellow students more so the fisheries class for working together and keeping our slogan of “Leave no One Behind”.

Lastly, I also recognize my family and friends for their endless prayers, moral and financial support throughout my study.

ABSTRACT

Nile perch is a source of food but most importantly, the maw from it is of great economic importance. This is because its price is almost twice that of the Nile perch fish meat. Despite the economic benefits of the maw, its source, the Nile perch is at great risk of depletion. This possesses a great threat to the fishery economy especially the revenue got from exporting Nile perch maw. This drove the need for a study to be conducted to understand how fish maw size is influenced by size of Nile perch and how the prices (both selling and purchasing) are influenced by Nile perch maw size at Kiyindi Landing site on Lake Victoria.

The study comprised of 301 individual Nile Perch fish which were obtained randomly from the fishermen at the Landing site. Two parameters, weight and length, were considered for the study in both the fish and the maw. Weight for individual fish and maws was measured using a weighing scale in (kgs) for the individual fish and (g) for the fish maws while length for individual fish and maws, was measured using a tape measure.

The findings of this study revealed a significant positive correlation between fish size and maw size at implying that maw size of Nile perch is directly affected by the fish size ($r=.799$ and $p=.000$ for fish and maw length), ($r=.831$ and $p=.000$ for fish length and maw weight), ($r=.822$ and $p=.000$ for fish weight and maw length), ($r=.847$ and $p=.000$ for fish weight and maw weight).. Furthermore, a significant positive correlation ($r=.828$, $p=.000$) was revealed between maw length and its selling price at $\alpha=0.01$.

The findings of this study will help alleviate the Uganda's revenue from Nile perch maw exporting thus boosting Uganda's economy. However, if more efforts to enforce strict laws on fishermen who harvest sexually immature fish are taken into consideration it will greatly improve Uganda's revenue base from the fishery industry.

CHAPTER ONE: INTRODUCTION

1.1 Back ground

Nile perch (*Lates niloticus*), a warm water fish species, is the most important commercial fish species in East Africa and approximately 100,000 tonnes of Nile perch are processed in Uganda alone, annually (Muyonga et al., 2004). Furthermore, it is the largest and biggest freshwater fish in the world (with mature weight ranging up to 200 kg and 2 meters in length) and most of the time this fish is caught before it can grow up to this size (Greenwood et al., 1966).

This fish species is native to Africa in the central, western and eastern zone of Africa water bodies widely in rivers and Lakes), and throughout the region of Ethiopia, Nile river (after Murchison fall on the White Nile), as well as the Congo, Niger, Volga, Senegal rivers and Lakes Chad and Turkana (Asnake, 2018). Studies suggest that this fish species was introduced in Lake Victoria between 1950s and early 1960s from Lake Albert and Lake Turkana (Mhithu & Chande, 2004; Okaromon et al., 1999).

This fish, like others, is a source of food to many people due to its nutritional composition (Okeyo et al., 2009). Its by-products such as fish maws drives its price since a kilogram of the maw fetches a far higher price than a kilogram of the fish itself (Guloba et al., 2022). The maws have also been used in continents such as Asia as they are believed to have some traditional medicinal properties, particularly in winter, as a tonic for those recovering from, attempting to ward off illness and for women after child delivery (Bagumire et al., 2018). Nile perch also has Uganda's highest commercial and recreational value (Guloba et al., 2022).

Despite this, its population has been affected by unsustainable fishing practices and environmental degradation (LVFO, 2016). There has also been a decline in the catch per unit effort (CPUE), a shift in distribution and diet, and a decline in body size of Nile perch according
